Indo-Sakura Software

AI-Assisted Product Catalog Modernization

Scope of Work and POC Summary

Prepared for discussion and presentation purposes

Ace Micromatic Group catalog transformation initiative

Scope of Work and POC Summary

1. Objective

The objective of this initiative is to help modernize the way product catalogs are updated, managed, reviewed, translated, and released across digital and print formats.

The proposed solution is intended to reduce manual coordination, improve update speed, ensure version control, and support multilingual catalog distribution while preserving a professional brand-aligned design standard.

2. Business Need

Today, product catalog updates often require coordination across multiple teams whenever there is a change in:

- product specifications
- product images
- machine features
- accessories
- layout or design content

This creates delays, increases the risk of outdated documents being shared, and makes it harder to maintain consistency across languages and versions.

3. What We Are Trying to Achieve

The goal is to create an AI-assisted catalog management capability that allows authorized users to:

- request catalog updates using simple prompts
- upload supporting change documents when needed
- generate updated catalog drafts quickly
- review and approve changes before release
- maintain version history
- support multilingual digital catalogs
- align catalog output with approved templates and branding

4. Complete Scope of Work

The full scope of work for the proposed solution includes the following capabilities:

4.1 Catalog Update Management

- Enable faster updates to product catalogs when specifications or design assets change
- Support both content updates and visual asset updates
- Reduce dependency on multiple manual handoffs

4.2 Template-Based Catalog Creation

- Support standardized catalog templates such as 2-page, 3-page, and future custom formats
- Allow catalogs to adapt to approved templates while maintaining quality and consistency
- Allow future onboarding of new templates as business needs evolve

4.3 Prompt-Based Editing Experience

- Provide a simple user interface where business users can request catalog edits in natural language
- Allow optional attachment of documents such as Excel, Word, or PDF to support requested changes
- Convert user inputs into draft catalog updates for review

4.4 Approval and Governance

- Introduce a structured review and approval process before final release
- Ensure that updated catalogs are validated by the right stakeholders before digital or print use
- Improve governance over catalog publishing

4.5 Version Control and Traceability

- Maintain catalog versions over time
- Keep track of updates and approved releases
- Reduce the risk of old and new versions being mixed

4.6 Multilingual Catalog Enablement

- Support digital catalog generation in multiple languages
- Prioritize Indian languages based on business need
- Improve reach and usability for wider customer communication

4.7 Design and Branding Alignment

- Preserve professional visual quality and brand consistency
- Support alignment with approved templates, assets, and design standards
- Enable future integration with the client's design ecosystem

4.8 Digital and Print Output Readiness

- Prepare approved digital versions for sharing
- Support print-ready outputs after approval
- Improve consistency between digital and printed catalog materials

5. Proposed POC

The POC is intended as a focused demonstration of the concept in a practical and believable form.

5.1 POC Objective

The objective of the POC is to demonstrate that an existing machine catalog can be updated through a prompt-based interface and quickly converted into an updated reviewable draft.

5.2 POC Scope

The POC will focus on a limited but meaningful use case, including:

- one sample catalog
- one approved template structure
- prompt-based update requests
- selected content edits such as title, specifications, features, or accessories
- updated draft preview
- approval step
- PDF export

5.3 What the POC Will Show

The POC is expected to show that the solution can:

- simplify catalog editing
- shorten turnaround time for changes
- produce a structured updated version for review
- support the foundation for future multilingual and multi-template expansion

5.4 POC Outcome

The POC is not intended to be the full enterprise solution. It is intended to validate the approach, demonstrate business value, and provide a clear path for phased implementation.

6. Expected Business Value

The expected value of this initiative includes:

- faster catalog update cycles
- better control over released versions
- reduced manual effort across teams
- improved consistency in content and branding
- better readiness for multilingual customer communication
- stronger foundation for future digital catalog operations

7. Recommended Next Step

The recommended next step is to proceed with the POC to validate the concept, demonstrate practical capability, and refine the roadmap for a broader production rollout.
